Progress of autonomic disturbances in narcolepsy type 1

Ying Wang¹, Qingqing Sun¹, Qi Tang¹, Yanan Zhang,
Mingyang Tang, Dong Wang and Zan Wang*

¹Sleep Center, Department of Neurology, The First Hospital of Jilin University, Changchun, China

Narcolepsy type 1 is a kind of sleep disorder characterized by a specific loss of hypocretin neurons in the lateral hypothalamus and reduced levels of hypocretin-1 in the cerebrospinal fluid. Hypocretin deficiency is associated with autonomic disorders. This article summarizes the autonomic disorders and possible mechanisms associated with narcolepsy type 1. Patients with narcolepsy type 1 often have various systemic autonomic symptoms, including non-dipping blood pressure, reduced heart rate variability, dynamic cerebral autoregulation impairment, reduced gastric motility and emptying, sleep-related erectile dysfunction, skin temperature abnormalities, and blunted pupillary light reflex. Similar findings should strengthen the recognition and intervention of these disturbances in clinical practice. In addition to hypocretin deficiency, current evidence also indicates that pharmacological therapy (including psychostimulants and anti-cataplectic drugs) and comorbidities may contribute to the alterations of autonomic system observed in narcolepsy type 1.

KEYWORDS

narcolepsy type 1, hypocretin, autonomic nervous system, sympathetic, parasympathetic

1. Introduction

Narcolepsy type 1 (NT1) is a chronic sleep disorder with major clinical manifestations including excessive daytime sleepiness, cataplexy (a sudden loss of muscle tone triggered by strong, mainly positive, emotions), sleep paralysis, hypnagogic hallucinations, and nocturnal sleep disorder (1). Patients can also present with multiple chronic comorbidities including obesity, depressive disorder, migraine, precocious puberty and other sleep disorders (such as rapid eye movement sleep behavior disorder and obstructive sleep apnea) (2). The most significant neuropathological change is the selective and irreversible loss of hypocretin-producing neurons in the lateral hypothalamus (3). Hypocretin neuropeptides consisted of hypocretin-1 (hcr1-1) and hypocretin-2 (hcr1-2), and they modulate their actions via hcr1 and hcr2 receptors. Patients with NT1 often have low levels of hcr1-1 in the cerebrospinal fluid.

Hypocretin neurons have widespread projections to different areas involved in regulating the sleep-wake cycle, energy metabolism, neuroendocrine, body temperature, and cardiovascular functions, which are associated with changes in the autonomic nervous system (4). Clinically, autonomic dysfunction often affects visceral organs, vascular smooth muscle, myocardium, and glands activities (5). However, autonomic symptoms are easily ignored compared with the typical symptoms in NT1. Here, we review the autonomic disorders and their possible mechanisms in patients with NT1 (Figure 1).

Disturbances Of Progress

J.G. Roederer

Disturbances Of Progress:

Disturbances of Progress Lise Downe, 2002 If the expression Two steps forward one step back describes the conventional attitude toward hesitation and uncertainty *Disturbances of Progress* takes those steps and turns them into a dance In an intimate and intensely personal manner Lise Downe s third major collection of poetry documents the sorts of interruptions that plague the lives of artists and writers Yet the poems themselves emerge as testament to the triumph of the artistic process over circumstance As the poet mulls over the uncertainty of her own life s trajectory she deftly weaves together the imagery of searching and the vagaries of language into a whole cloth Downe s writing uses the qualities of colloquial speech hesitation interjection digression and repetition to convey the experience of writing as an unforeseen progression Favouring intuitive progress over linear intention these vivid painterly poems reflect the dynamic between the known and the unknown
