Distributed Group Communication:

Networked Group Communication Luigi Rizzo, Serge Fdida, 2004-06-22 Enabling group communication is one of the major challenges for the future Internet. Various issues ranging from services and applications to protocols and infrastructure have to be addressed. Moreover, they need to be studied from various angles and therefore involve skills in multiple areas. COST264 was created to contribute to this international effort towards group communication and related technologies. The European COST framework is ideal for establishing a new community of interest providing an open forum for ideas and also supporting young researchers in the field. The COST264 action officially started in late 1998 aims at leveraging the European research in this area and creating intensive interaction at the international level. To this purpose, COST264 decided to organize an annual technical workshop: the International Workshop on Networked Group Communication (NGC 99). In Pisa is the first event of the series. Despite this being the first workshop and despite the very short time between the Call for Papers and the deadline for submissions and the other conflicting and more established events, the Call for Papers of NGC 99 was highly successful: we received 49 papers of which 18 were selected to compose the basis of the technical program. We hope you will enjoy our paper selection which is the VI Preface core of these proceedings and addresses important issues in the research and development of networked group communication. In addition to refereed contributions, we scheduled two keynote speakers: Christophe Diot and Steve Deering, and four invited talks by Ken Birman (Cornell), Bob Briscoe (BT), Radia Perlman (SUN), and Tony Speakman (Cisco).

Group Communication Torsten Reimer, Ernest S. Park, Joseph A. Bonito, 2023-11-30 In this comprehensive advanced introduction to group communication, the field's leading experts summarize theory, methodological advancements, and current research in the field. This book follows a coherent structure specifying clear objectives and evidence-based practical implications for the management of groups. Each chapter provides case study examples highlighting the role of communication for group functioning. The textbook takes a particular look at recent advancements in the research on virtual teams, the role of technology in group communication, and issues of diversity and inclusion, considering group communication in various situations including health and organizational contexts. It features theory-driven descriptions, an emphasis on empirical findings, and reflections on research methods. The book is an integrative and coherent textbook for advanced undergraduate and graduate group communication classes and a useful reference for students, scholars, and group communication professionals across different disciplines, including communication studies, psychology, life sciences, business administration, management, and engineering. Online resources include a sample course syllabus, discussion questions, lecture slides, and a test bank. Krakowiak,Santosh Shrivastava,2003-06-26 In 1992 we initiated a research project on large scale distributed computing systems LSDCS It was a collaborative project involving research institutes and universities in Bologna Grenoble Lausanne Lisbon Rennes Rocquencourt Newcastle and Twente The World Wide Web had recently been developed at CERN but its use was not yet as common place as it is today and graphical browsers had yet to be developed It was clear to us and to just about everyone else that LSDCS comprising several thousands to millions of individual computer systems nodes would be coming into existence as a consequence both of technological advances and the demands placed by applications We were excited about the problems of building large distributed systems and felt that serious rethinking of many of the existing

computational paradigms algorithms and structuring principles for distributed computing was called for In our research proposal we summarized the problem domain as follows We expect LSDCS to exhibit great diversity of node and communications capability Nodes will range from mobile laptop computers workstations to supercomputers Whereas mobile computers may well have unreliable low bandwidth communications to the rest of the system other parts of the system may well possess high bandwidth communications capability To appreciate the problems posed by the sheer scale of a system comprising thousands of nodes we observe that such systems will be rarely functioning in their entirety

Distributed Platforms Alexander Schill, 2013-04-18 Client Server applications are of increasing importance in industry and have been improved by advanced distributed object oriented techniques dedicated tool support and both multimedia and mobile computing extensions Recent responses to this trend are standardized distributed platforms and models including the Distributed Computing Environment DCE of the Open Software Foundation OS F Open Distributed Processing ODP and the Common Object Request Broker Architecture CORBA of the Object Management Group OMG These proceedings are the compilation of papers from the technical stream of the IFIP/IEEE International Conference on Distributed Platforms Dresden Germany This conference has been sponsored by IFIP TC6 1 by the IEEE Communications Society and by the German Association of Computer Science GI Gesellschaft fur Informatik ICDP 96 was organized jointly by Dresden University of Technology and Aachen University of Technology It is closely related to the International Workshop on OSF DCE in Karlsruhe 1993 and to the IFIP International Conference on Open Distributed Processing ICDP has been designed to bring together researchers and practitioners who are studying and developing new methodologies tools and technologies for advanced client server environments distributed systems and network applications based on distributed platforms

Introduction to Reliable Distributed Programming Rachid Guerraoui, Luís Rodrigues, 2006-05-01 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Guerraoui and Rodrigues present an introductory description of fundamental reliable distributed programming abstractions as well as algorithms to implement these abstractions The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one specific class of abstractions covering reliable delivery shared memory consensus and various forms of agreement This textbook comes with a companion set of running examples implemented in Java These can be used by students to get a better understanding of how reliable distributed programming abstractions can be implemented and used in practice Combined the chapters deliver a full course on reliable distributed programming The book can also be used as a complete reference on the basic elements required to build reliable distributed applications
