Diving And Asphyxia A Comparative Study Of Animals And Man:

Diving and Asphyxia Robert Elsner, Brett Gooden, 1983-07-21 This book concerns the comparative physiological adaptations of vertebrate animals especially mammals to cessation of breathing Diving Physiology of Marine Mammals and Seabirds Paul J. Ponganis, 2015-11-26 An up to date synthesis of comparative diving physiology research illustrating the features of dive performance and its biomedical and ecological relevance **Advances in Comparative and Environmental Physiology**, 2012-12-06 Advances in Comparative and Environmental Physiology helps biologists physiologists and biochemists keep track of the extensive literature in the field Providing comprehensive integrated reviews and sound critical and provocative summaries this series is a must for all active researchers in environmental and comparative physiology **Encyclopedia of the Antarctic** Beau Riffenburgh, 2007 Publisher description **Was Man More Aquatic in the Past? Fifty Years After Alister Hardy - Waterside Hypotheses of Human Evolution** Mario Vaneechoutte, Algis Kuliukas, Marc Verhaegen, 2011 The book starts from the observation that humans are very different from the other primates Why are we naked Why do we speak Why do we walk upright Fifty years ago in 1960 marine biologist Sir Alister Hardy tried to answer this when he announced his so called aquatic hypothesis human ancestors did not live in dry savannahs as traditional anthropology assumes but have adapted to live at the edge between land and water gathering both terrestrial and aquatic foods This eBook is an up to date collection of the views of the most important protagonists of this long neglected theory of humankind **Diving Seals & Meditating Yogis** Robert Elsner, 2015-04-21 The comparative physiology of seemingly disparate organisms often serves as a surprising pathway to biological enlightenment How appropriate then that Robert Elsner sheds new light on the remarkable physiology of diving seals through comparison with members of our own species on quests toward enlightenment meditating yogis As Elsner reveals survival in extreme conditions such as those faced by seals is often not about running for cover or coming up for air but rather about working within the confines of an environment and suppressing normal bodily function Animals in this withdrawn state display reduced resting metabolic rates and are temporarily less dependent upon customary levels of oxygen For diving seals creatures especially well adapted to prolonged submergence in the ocean's cold depths such periods of rest lengthen dive endurance But while human divers share modest brief adjustments of suppressed metabolism with diving seals it is the practiced response achieved during deep meditation that is characterized by metabolic rates well below normal levels sometimes even approaching those of non-exercising diving seals And the comparison does not end here hibernating animals infants during birth near drowning victims and clams at low tide all also display similarly reduced metabolisms By investigating these states and the regulatory functions that help maintain them across a range of species Elsner offers suggestive insight into the linked biology of survival and well being Diving in Animals and Man Alf O. Brubakk, John W. Kanwisher, Gunnar Sundnes, 1986 *Biochemical Adaptation* Peter W. Hochachka, George N. Somero, 2002-01-17 The study of biochemical adaption provides fascinating

insights into how organisms work and how they evolve to sustain physiological function under a vast array of environmental conditions This book describes how the abilities of organisms to thrive in widely different environments derive from two fundamental classes of biochemical adaptations modifications of core biochemical processes that allow a common set of physiological functions to be conserved and inventions of new biochemical traits that allow entry into novel habitats Biochemical Adaptation Mechanisms and Process in Physiological Evolution asks two primary questions First how have the core biochemical systems found in all species been adaptively modified to allow the same fundamental types of physiological processes to be sustained throughout the wide range of habitat conditions found in the biosphere Second through what types of genetic and biochemical processes have new physiological functions been fabricated The primary audience for this book is faculty senior undergraduates and graduate students in environmental biology comparative physiology and marine biology Other likely readers include workers in governmental laboratories concerned with environmental issues medical students interested in some elements of the book and medical researchers

Marine Mammals Annalisa Berta, James L. Sumich, Kit M. Kovacs, 2005-12-14 Berta and Sumich have succeeded yet again in creating superior marine reading This book is a succinct yet comprehensive text devoted to the systematics evolution morphology ecology physiology and behavior of marine mammals The first edition considered the leading text in the field is required reading for all marine biologists concerned with marine mammals Revisions include updates of citations expansion of nearly every chapter and full color photographs This title continues the tradition by fully expanding and updating nearly all chapters Comprehensive up to date coverage of the biology of all marine mammals Provides a phylogenetic framework that integrates phylogeny with behavior and ecology Features chapter summaries further readings an appendix glossary and an extensive bibliography Exciting new color photographs and additional distribution maps

Modeling and Control of Ventilation Stephen J.G. Semple, Lewis Adams, Brian J. Whipp, 2012-12-06 The origins of what have come to be known as the Oxford Conferences on modelling and the control of breathing can be traced back to a discussion between Dan Cunningham and Richard Hercynski at a conference dinner at the Polish Academy of Sciences in 1971 Each felt that they had benefited from the different perspectives from which the topic of ventilatory control was approached predominantly physiological in the case of Dr Cunningham and predominantly mathematical in the case of Dr Hercynski Their judgement at that time was that a conference on the control of breathing which allowed investigators with these different but related scientific perspectives to present and discuss their work might prove fruitful We would judge that this has amply been borne out based upon the success of the series of conferences which resulted from that seminal dinner conversation The first conference entitled Modelling of a Biological Control System The Regulation of Breathing was held in Oxford UK in 1978 Subsequent conferences were Modelling and the Control of Breathing at Lake Arrowhead California in 1982 Concepts and Formulations in the Control of Breathing in Solignac France in 1985 Respiratory Control A Modeling Perspective at Grand Lakes Colorado in 1988 and Control of

Breathing and Its Modelling Perspective at the Fuji Institute in Japan in 1991 The conferences subsequent to the one in Oxford have all resulted in well received published proceedings

Medical Aspects of Harsh Environments Kent B. Pandolf, R. E. Burr, 2001 Describes and illustrates the medical conditions caused by heat and cold including topics ranging from heat illness prevention to the treatment of hypothermia Provides historical background and current information on the physiology physical derangements psychology prevention and treatment of heat and cold related environmental illnesses and injuries Contains a color atlas of cold injuries and their treatment

Oxidative Stress in Aquatic Ecosystems Doris Abele, Jose Pablo Vazquez-Medina, Tania Zenteno-Savin, 2011-11-03 Reactive oxygen species ROS are increasingly appreciated as down stream effectors of cellular damage and dysfunction under natural and anthropogenic stress scenarios in aquatic systems This comprehensive volume describes oxidative stress phenomena in different climatic zones and groups of organisms taking into account specific habitat conditions and how they affect susceptibility to ROS damage A comprehensive and detailed methods section is included which supplies complete protocols for analyzing ROS production oxidative damage and antioxidant systems Methods are also evaluated with respect to applicability and constraints for different types of research The authors are all internationally recognized experts in particular fields of oxidative stress research This comprehensive reference volume is essential for students researchers and technicians in the field of ROS research and also contains information useful for veterinarians environmental health professionals and decision makers

Animal Physiology Knut Schmidt-Nielsen, 1997-06-09 How do dolphins catch fish in murky water Why do moths drink from puddles How do birds eggs breathe How do animals work In this revised and updated edition of the acclaimed text *Animal Physiology* the answers are revealed In clear and stimulating style Knut Schmidt Nielsen introduces and develops the fundamental principles of animal physiology according to major environmental features oxygen food and energy temperature and water The structure of the book is unchanged from the previous edition but every chapter has been updated to take into account recent developments with numerous new references and figures *Animal Physiology* is suitable as a text for undergraduate and beginning graduate courses in physiology As with previous editions students teachers as well as researchers will find this book a valuable and enjoyable companion to course work and research

The Design of Mammals John William Prothero, 2015-10-22 A uniquely comprehensive examination of

Kooyman, 2012-12-06 This book is not a conventional review of diving physiology The coverage of the literature has been selective rather than encompassing the emphasis has been on field studies rather than laboratory investigations and the dive responses described are often discussed from the perspective of some of the flaws or weaknesses in the conclusions Some of these points are of more historical interest to note how our concepts have evolved as we learn more about behavior and responses to natural diving in contrast to forced submersions in the laboratory As a result there is a degree of evaluation of some experiments on my part that may seem obvious or controversial to the specialist I have followed this plan at times in order to aid the reader who I hope is often an undergraduate or graduate student the nonspecialist and the layman in appreciating to some degree the level of dissatisfaction or skepticism about certain areas of research in diving physiology In view of historical boundaries in vertebrate biology the subject is of broad enough importance to catch the interest of a wide audience of readers if I have done my job well For example of the major epochal transitions or events there have been in vertebrate history three come immediately to mind 1 The transition from aquatic to aerial respiration which ultimately led to a broad occupation of terrestrial habitats 2 The development of endothermy **Biology of Marine Mammals** John E. Reynolds, 2013-08-06 Taking an integrated approach to the biology of marine carnivores cetaceans and sirenians twenty two prominent researchers compare marine mammals with one another and with terrestrial mammals providing a framework for fundamental biological and ecological concepts They describe functional morphology sensory systems energetics

reproduction communication and cognition behavior distribution population biology and feeding ecology They also detail the physiological adaptations for such activities and processes as diving thermo regulation osmoregulation and orientation that enable marine mammals to exploit their aquatic environment
